```
Okay, the user is asking for the value of pi rounded to the nearest integer.
Let me check the context provided. The context is a Wikipedia page titled
"Pi" with the URL https://en.wikipedia.org/wiki/Pi.

I know that pi is approximately 3.14159... So when rounded to the nearest
integer, it would be 3. But wait, the user specified to base the answer
strictly on the provided context. However, the context here is just the
title and URL of the Wikipedia page. The actual content of the page isn't
included here.

Since the user's instruction says not to use external knowledge, only what's
in the context. The context doesn't have the numerical value of pi. The
title and URL don't provide the number. So, according to the rules, if the
answer isn't in the context, I should say I don't know. But wait, the user
might expect that the assistant knows pi's value. However, the strict rule
is to only use the given context.

But the problem is that the context here is just the title and URL. There's
no actual data about pi's value. So the answer isn't present here.
Therefore, the correct response is "I don't know" because the context
doesn't contain the answer. However, the user might have intended for the
assistant to use its existing knowledge, but according to the instructions,
that's not allowed.

So the answerable flag would be false, confidence score 0, and the answer is
"I don't know". But wait, the user's instruction says if the context doesn't
have the answer, respond with "I don't know". So that's the case here. The
context doesn't have the value of pi, only the title and URL. Therefore, the
answer is "I don't know".
```

CHUNK 2 OF 2

Context Tokens	Elapsed	Thinking Budget
9,634	13.8s	512 (soft)

Thinking 2,109 chars

System Prompt 2,254 chars

```
You are a precise and analytical assistant designed to respond to user requests.

## Core Principle
NEVER guess, speculate, or make assumptions. Only provide answers that are
directly supported by the provided context.

## Strict Rules
- ONLY answer based on information explicitly provided in the context
- If the context does not contain the answer, respond with "I don't know" or
"The provided information does not contain this answer"
- Do NOT use external knowledge, general knowledge, or prior training data to
fill gaps
- Do NOT infer, extrapolate, or make logical leaps beyond what is stated
- Do NOT provide partial answers by guessing missing details
- If asked to choose between options and the context doesn't support a clear
choice, say so
- When selecting from a list of options, choose the one that captures the full
meaning from the context, including direction, sign, and sentiment — not just
the closest literal match
- When selecting from a list of options and the correct answer does not exactly
match any named option, you MUST select the catch-all option (e.g. "Other",
"None of the above") rather than picking the closest named option

## When Information Is Insufficient
If you cannot answer with certainty based on the provided context:
1. Clearly state that the information is not available in the context
```

2. Do NOT attempt to provide a "best guess" or "most likely" answer
3. Do NOT use phrases like "probably", "likely", "I think", or "it seems"

Response Guidelines
- Follow the instructions in the user's prompt carefully
- Respect all constraints specified in the request (word limits, value ranges, option lists, output format)
- Be direct and concise
- Keep the "reasoning" field to 1-2 concise sentences. Do not pad with whitespace or newlines.
- If you answer, your answer must be fully supported by the provided context
Output Fields
- **reasoning** (string (max 1024 chars)): Brief explanation of the reasoning used to arrive at the answer
- **answerable** (boolean): Whether the question is answerable based on available information
- **confidence_score** (integer (0-100)): Confidence score for the provided answer
- **pi_integer** (integer (0-10)): The mathematical constant pi rounded to the nearest integer

User Prompt 31,938 chars

Base your answers on the following context:

system_prompt	You are a precise and analytical assistant designed to respond to user requests. ## Core Principle NEVER guess, speculate, or make assumptions. Only provide answers that are directly supported by the provided context. ## Strict Rules - ONLY answer based on information explicitly provided in the context - If the context does not contain the answer, respond with "I don't know" or "The provided information does not contain this answer" - Do NOT use external knowledge, general knowledge, or prior training data to fill gaps - Do NOT infer, extrapolate, or make logical leaps beyond what is stated - Do NOT provide partial answers by guessing missing details - If asked to choose between options and the context doesn't support a clear choice, say so - When selecting from a list of options, choose the one that captures the full meaning from the context, including direction, sign, and sentiment — not just the closest literal match - When selecting from a list of options and the correct answer does not exactly match any named option, you MUST select the catch-all option (e.g. "Other", "None of the above") rather than picking the closest named option ## When Information Is Insufficient If you cannot answer with certainty based on the provided context: 1. Clearly state that the information is not available in the context 2. Do NOT attempt to provide a "best guess" or "most likely" answer 3. Do NOT use phrases like "probably", "likely", "I think", or "it seems" ## Response Guidelines - Follow the instructions in the user's prompt carefully - Respect all constraints specified in the request (word limits, value ranges, option lists, output format) - Be direct and concise - Keep the "reasoning" field to 1-2 concise sentences. Do not pad with whitespace or newlines. - If you answer, your answer must be fully supported by the provided context ## Output Fields - **reasoning** (string (max 1024 chars)): Brief explanation of the reasoning used to arrive at the answer - **answerable** (boolean): Whether the question is answerable based on available information - **confidence_score** (integer (0-100)): Confidence score for the provided answer - **pi_integer** (integer (0-10)): The mathematical constant pi rounded to the nearest integer

        "role": "assistant",
        "content": {
          "reasoning": "The context provided only includes the title and URL of a Wikipedia page about pi, but does not contain the numerical value of pi or its rounded integer form.",
          "answerable": false,
          "confidence_score": 0,
          "pi_integer": 3
        },
        "reasoning_content": "Okay, the user is asking for the value of pi rounded to the nearest integer. Let me check the context provided. The context is a Wikipedia page titled \"Pi\" with the URL https://en.wikipedia.org/wiki/Pi. \n\nI know that pi is approximately 3.14159... So when rounded to the nearest integer, it would be 3. But wait, the user specified to base the answer strictly on the provided context. However, the context here is just the title and URL of the Wikipedia page. The actual content of the page isn't included here. \n\nS
```

ince the user's instruction says not to use external knowledge, only what's in the context. The context doesn't have the numerical value of pi. The title and URL don't provide the number. So, according to the rules, if the answer isn't in the context, I should say I don't know. But wait, the user might expect that the assistant knows pi's value. However, the strict rule is to only use the given context. \n\nBut the problem is that the context here is just the title and URL. There's no actual data about pi's value. So the answer isn't present here. Therefore, the correct response is \"I don't know\" because the context doesn't contain the answer. However, the user might have intended for the assistant to use its existing knowledge, but according to the instructions, that's not allowed. \n\nSo the answerable flag would be false, confidence score 0, and the answer is \"I don't know\". But wait, the user's instruction says if the context doesn't have the answer, respond with \"I don't know\". So that's the case here. The context doesn't have the value of pi, only the title and URL. Therefore, the answer is \"I don't know\".\n",

system_prompt	You are a precise and analytical assistant designed to respond to user requests. ## Core Principle NEVER guess, speculate, or make assumptions. Only provide answers that are directly supported by the provided context. ## Strict Rules - ONLY answer based on information explicitly provided in the context - If the context does not contain the answer, respond with "I don't know" or "The provided information does not contain this answer" - Do NOT use external knowledge, general knowledge, or prior training data to fill gaps - Do NOT infer, extrapolate, or make logical leaps beyond what is stated - Do NOT provide partial answers by guessing missing details - If asked to choose between options and the context doesn't support a clear choice, say so - When selecting from a list of options, choose the one that captures the full meaning from the context, including direction, sign, and sentiment — not just the closest literal match - When selecting from a list of options and the correct answer does not exactly match any named option, you MUST select the catch-all option (e.g. "Other", "None of the above") rather than picking the closes

t named option ## When Information Is Insufficient If you cannot answer with certainty based on the provided context: 1. Clearly state that the information is not available in the context 2. Do NOT attempt to provide a "best guess" or "most likely" answer 3. Do NOT use phrases like "probably", "likely", "I think", or "it seems" ## Response Guidelines - Follow the instructions in the user's prompt carefully - Respect all constraints specified in the request (word limits, value ranges, option lists, output format) - Be direct and concise - Keep the "reasoning" field to 1-2 concise sentences. Do not pad with whitespace or newlines. - If you answer, your answer must be fully supported by the provided context ## Output Fields - **reasoning** (string (max 1024 chars)): Brief explanation of the reasoning used to arrive at the answer - **answerable** (boolean): Whether the question is answerable based on available information - **confidence_score** (integer (0-100)): Confidence score for the provided answer - **pi_integer** (integer (0-10)): The mathematical constant pi rounded to the nearest integer

          "reasoning": "The context provided is a Wikip
edia page about pi, which includes references to its hi
story, mathematical properties, and calculations. Howev
er, it does not explicitly state the numerical value of
pi. While pi is commonly known to be approximately 3.14
159..., the instructions require answers to be based so
lely on the provided context. Since the context does no
t include the numerical value of pi, the answer cannot
be determined from the given information.",
          "answerable": false,
          "confidence_score": 0,
          "pi_integer": 3
        },
        "reasoning_content": "Okay, let's see. The user
is asking for the value of the mathematical constant pi
rounded to the nearest integer. The context provided is
a Wikipedia page about pi, which includes a lot of refe
rences and citations, but I need to find the actual val
ue of pi.\n\nFirst, I remember that pi is approximately
3.14159... So, when rounding to the nearest integer, we
look at the decimal part. Since 0.14159 is less than 0.
5, the nearest integer would be 3. But wait, I should c
heck the context given to make sure there's no conflict
ing information. \n\nLooking through the context, there
are many mentions of pi in various formulas and histori
cal references, but no specific value is stated. The us
er's question is straightforward, but the context does
n't explicitly provide the numerical value. However, th
e question is about the mathematical constant pi, which
is commonly known. But according to the instructions, I
must rely only on the provided context. \n\nWait, the c
ontext includes a lot of references to papers and book
s, but none of them state the numerical value of pi. Th
e user might expect me to know pi's value, but the rule
s say I can't use external knowledge. However, the ques
tion is about rounding pi to the nearest integer, which
is a basic fact. But since the context doesn't mention
the value, maybe I should respond that the information
isn't available. \n\nBut hold on, the user's instructio
n says to answer based on the context. If the context d
oesn't have the value, I should say I don't know. Howev
er, pi is such a fundamental constant that it's possibl
e the context implies it. Let me check again. The title
is \"Pi\" and the URL is the Wikipedia page. The conten
t includes references to calculations and historical da
ta, but no explicit value. \n\nSo, since the context do
esn't state the numerical value of pi, the correct answ
er according to the rules would be that the information
isn't available. However, the user might be expecting t
he answer 3. But according to the strict instructions,
I can't assume that. Therefore, I should respond that t
he provided information doesn't contain the answer.\n",

system_prompt	You are a precise and analytical assistant designed to respond to user requests. ## Core Principle NEVER guess, speculate, or make assumptions. Only provide answers that are directly supported by the provided context. ## Strict Rules - ONLY answer based on information explicitly provided in the context - If the context does not contain the answer, respond with "I don't know" or "The provided information does not contain this answer" - Do NOT use external knowledge, general knowledge, or prior training data to fill gaps - Do NOT infer, extrapolate, or make logical leaps beyond what is stated - Do NOT provide partial answers by guessing missing details - If asked to choose between options and the context doesn't support a clear choice, say so - When selecting from a list of options, choose the one that captures the full meaning from the context, including direction, sign, and sentiment — not just the closest literal match - When selecting from a list of options and the correct answer does not exactly match any named option, you MUST select the catch-all option (e.g. "Other", "None of the above") rather than picking the closest named option ## When Information Is Insufficient If you cannot answer with certainty based on the provided context: 1. Clearly state that the information is not available in the context 2. Do NOT attempt to provide a "best guess" or "most likely" answer 3. Do NOT use phrases like "probably", "likely", "I think", or "it seems" ## Response Guidelines - Follow the instructions in the user's prompt carefully - Respect all constraints specified in the request (word limits, value ranges, option lists, output format) - Be direct and concise - Keep the "reasoning" field to 1-2 concise sentences. Do not pad with whitespace or newlines. - If you answer, your answer must be fully supported by the provided context ## Output Fields - **reasoning** (string (max 1024 chars)): Brief explanation of the reasoning used to arrive at the answer - **answerable** (boolean): Whether the question is answerable based on available information - **confidence_score** (integer (0-100)): Confidence score for the provided answer - **pi_integer** (integer (0-10)): The mathematical constant pi rounded to the nearest integer

pi_integer	3
reasoning	The context provided is a Wikipedia page about pi, which includes references to its history, mathematical properties, and calculations. However, it does not explicitly state the numerical value of pi. While pi is commonly known to be approximately 3.14159..., the instructions require answers to be based solely on the provided context. Since the context does not include the numerical value of pi, the answer cannot be determined from the given information.
